TITLE: The Influence of Meteorological Conditions on the Intensity of Light Scintillation Near the Surface of the Earth (O vliyaniy meteorologicheskikh usloviy na intensivnost' mertsaniya sveta v prizemnom sloye atmosfery)

PERIODICAL: Astronomicheskiy zhurnal, 1958, Vol 35, Nr 4, pp 623-626 (USSR)

ABSTRACT: The authors report on the experimental investigation of the dependence of scintillation of a source on the earth on the meteorological conditions. The observations have been carried out in autumn 1956 by an astrophysical expedition of the Institute for Atmospheric Physics, Academy of Science USSR. It was stated that the intensity of scintillation and the vertical gradient of the mean temperature strongly correlate (correlation coefficient 0.92) which shows a good coincidence with the theoretical results of the authors. The investigations have a provisional character and are to be continued.

TITLE:

An Experimental Investigation of Sound Scattering in a Turbulent Atmosphere (Eksperimental'noye issledovaniye rasseyaniya zvuka v turbulentnoy atmosfere)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 1, pp 69-72 (USSR)

ABSTRACT:

Pertinent earlier investigations are first mentioned in short. In order to verify the theory of wave scattering at a turbulence in real atmosphere it is of interest to carry out a direct experimental investigation of sound scattering in the earth-near atmospheric layer. In this earth-near layer the characteristics of turbulence may be evaluated on the basis of meteorological measurements (altitude distribution of wind and temperature). The experiments on sound scattering were made in September 1958 at the Tsimlyansk stantsiya Instituta fiziki atmosfery AN SSSR (Tsimlyansk Station of the Institute for Physics of the Atmosphere of the AS USSR). Figure 1 shows a scheme of the experiment and a block diagram of the measuring device. The sound source is an efficient planar condenser-transducer (0.8 . 0.9 m large) with a narrow directivity diagram. A converter of this type also served as microphone.

Card 1/3

SOV/20-125-1-17/67

An Experimental Investigation of Sound Scattering in a Turbulent Atmosphere

Sound source and microphone were parted by a distance of $2R = 40$ m. The direct and the scattered signal were observed visually with a cathode-ray oscilloscope. Figure 2 shows a series of photographs of the oscilloscope screen. With increasing scattering angle the retardation of the scattered pulse increases with respect to the direct pulse, but its amplitude decreases at the same time. A formula for the intensity of the radiation scattered from the volume V (with any form of spectral density of the refractive index $\phi_n(\vec{K})$) is then derived. This formula is also in good agreement with the experimental data of the magnitude of intensity of the scattered signal for the scattering angles 25° and 30° . The theory based on the hypothesis of the local homogeneous turbulence offers a correct description of the observed dependence of the scattering intensity on the intensity of pulsations. There are 4 figures and 8 references, 6 of which are Soviet.

TITLE: The Consideration of the Vorticity of the Wind Field in Calculating Sound Scattering in the Atmosphere

PERIODICAL: Akusticheskiy zhurnal, 1960, Vol. 6, No. 4, pp. 503 - 505

TEXT: Tatarskiy and other Russian scientists, in calculating the sound scattering by turbulent pulsations of the wind velocities and the temperature in the atmosphere proceeded from the differential equation

$$\Delta \varphi - \frac{1}{c^2} \frac{\partial^2 \varphi}{\partial t^2} = \frac{2\vec{v}'}{c^2} \nabla \frac{\partial \varphi}{\partial t} \quad (1)$$

and from the acoustic theory of non-uniformly moving media. Here φ is the potential of the acoustic velocity, c - the velocity of sound, and \vec{v}' the pulsation rate of the wind. In the present paper reference is made to experimental results obtained at the Tsimlyanskaya nauchnaya stantsiya Instituta fiziki atmosfery AN SSSR (Tsimlyansk Scientific Station of the Institute of the Physics of the Atmosphere of the AS USSR), and it is

shown that the assumptions made by the scientists mentioned are not justified. Already the American Kraichnan (Ref. 4) solved the problem without using the sound potential and the essential restriction $\text{curl} = 0$. The authors show in this case that, especially in the case of large scattering angles, the vorticity of the wind field must not be neglected when investigating the scattering of sound waves. TITLE: An experimental study of the vibration of an artificial source of light

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiofizika, v.4, no.5, 1961, 886-891

TEXT: The static vibration characteristics, the dispersion, and the frequency spectrum were investigated with the aid of the apparatus shown in Fig.1. The light source NC was placed behind a slit whose width was such that the angular dimensions of the source were of the order of $2''$. The source was placed at a distance L from a telescope. The mirror of a single-loop galvanometer Γ was placed between the objective O of the telescope and its focal point at a distance of about 1 cm from the latter. Light reflected from the mirror was focused by a second objective (not shown in the figure) onto a 50μ slit. The width of this slit was smaller by a factor of approximately 2 than the image of the source produced by the second objective. The photo-multiplier $\Phi\Delta Y$ was placed behind the slit. When the position of

Card 1/4

the source is changed the system may be re-focused by displacing the objective of the telescope. The vibration was measured with the aid of a tracking system operating on a carrier frequency of 5 kc/s. The carrier frequency signal derived from an audio-frequency oscillator was fed into the loop through an adding circuit Σ (balanced bridge). The amplitude of the oscillation of the image was of the order of 35 to 40 μ . The photomultiplier output was fed into the amplifier γ (band-width 4800-5200 cps). If the average position of the image (per period) is at the mid-point of the slit, then the photomultiplier signal contains frequency components $2f$, $4f$ etc. but the component with frequency f (period = $1/f$) is absent. The amplitude of the latter component is proportional to the displacement of the average position of the image from the mid-point of the slit and the phase is the same as the phase of the oscillations of the loop or differs from it by 180° depending on whether the image is displaced to the left or to the right. The amplifier will transmit only those frequencies which are approximately equal to f . The amplifier is followed by the synchronous detector $C\Delta$ whose output is fed to the galvanometer loop through the adding circuit Σ . The variance of Card 2/4

An experimental study of the ...

E032/E514

the vibration was measured with the aid of an electrodynamic multiplier with negative feedback which was similar to that described by G. Korn and T. Korn (Ref.6: Electronic analogue computers, 1952 (Russian translation IL, M, 1955)). The scale of the multiplier was graduated in units of the variance of the angle of incidence $\sigma_{\varphi}^2 = (\varphi - \bar{\varphi})^2$. The variance σ_{φ}^2 was measured as a function of L and of the meteorological conditions. It was found that, on the average, the plot of σ_{φ}^2 vs. L is a straight line. This is in agreement with the theoretical formula reported by V. I. Tatarskiy (Ref.1: Theory of fluctuations in the propagation of waves in a turbulent atmosphere, Izd.AN SSSR, M., 1959). The experimental data obtained for the intensity of fluctuation in the angle of incidence are also in good agreement with calculations based on meteorological measurements of temperature gradients and wind speed. The spectrum of fluctuations in the angle of incidence is in good agreement with the theoretical calculations based on the Kolmogorov-Obukhov theory of turbulence. There are 5 figures and 7 Soviet references.

TITLE: Experimental studies of the scattering of sound waves
in the atmosphere

SOURCE: Akademiya nauk SSSR. Institut fiziki atmosfery. Trudy.
no. 4. 1962. Atmosfernaya turbulentnost'. 203 - 256

TEXT: This paper reviews experimental studies of the scattering
of sound in the atmosphere, which were carried out at the
Tsimlyanskaya nauchnaya stantsiya Instituta fiziki atmosfery AN
SSSR (Tsimlyanskiy Scientific Station of the Institute of Physics
of the Atmosphere of the AS USSR), and the associated theoretical
background. The experiments were carried out on an open steppe in
1958 and 1959. The vertical profiles of the average wind velocity
and average temperature were measured at the same time. The aim
was to verify a theoretical formula for the intensity of scattered
sound waves as a function of the meteorological conditions,
frequency and angle of scattering. Both the sound-wave generator
and the detector were highly directional, so that the scattering
could be looked upon as being due to a localized region in the
Card 1/6

Experimental studies

atmosphere. Preliminary data were obtained in 1958 using electrostatic converters, type MKI-I (MKI-I). The sound-generator and the microphone were arranged as shown in Fig. 14. They were at a fixed distance of 40 m from each other. The transmitter produced 1.5 μ s pulses at a repetition frequency of 30 c.p.s. and a carrier frequency of 11 kc/s. The intensity was measured at scattering angles between 16 and 180°. The sensitivity of the apparatus was such that scattered signals equal to 10⁻¹⁴ of the intensity of the transmitted signal could be detected. The apparatus thus provided a means of direct experimental determination of the scattering of sound by turbulent pulsations in wind velocity and temperature. The general variation in the scattering intensity as a function of the scattering angle was found to be in agreement with theoretical predictions, e.g. there are minima in the scattering function at $\theta = 90$ and 180°. A formula for the effective scattering cross-section derived on the assumption that $\text{curl } \underline{v} \neq 0$ was found to leads to a discrepancy as compared with experimental data for large scattering angles θ at which a $\cos^2 \theta$ factor was found to have a strong effect. The three-dimensional spectral-energy density of turbulent pulsations calculated from the dependence of the

Card 2/4

Experimental studies

scattered intensity on Θ in the range $\Theta = 16 - 70^\circ$, which corresponded to irregularities with linear dimensions between 3 and 12 cm, was of the form $\sim (\sin \Theta/2)^{-11/3}$, which was in good agreement with the theories of A.N. Kolmogorov (Dokl. AN SSSR, 30, 299, 1941) and A.M. Obukhov (Izv. AN SSSR, seriya geogr. i geofiz., no. 4-5, 453, 1941; v.13, no. 1, 1949; no. 3, 1951). At small angles ($\Theta \approx 16 - 30^\circ$) the effective scattering cross-section was of the form $\sigma_\Theta \sim (\sin \Theta/2)^{-11/3}$. The absolute value of the scattered signal at $16^\circ < \Theta < 70^\circ$ was also in good agreement with theoretical predictions. The effective scattering cross-section per unit volume at $\Theta = 30^\circ$ was found to be of the order of $0.8 \times 10^{-6} \text{ cm}^{-1}$. This value was found to reduce to 3.4×10^{-12} at 180° , which was lower by two orders of magnitude as compared with the theory. A study of the dependence of the scattered intensity of meteorological conditions showed that: 1) there was good agreement between the theoretically predicted effective scattering cross-section as a function of the meteorological conditions and 2) up to $\Theta = 80^\circ$ the principal contribution to the scattered intensity was due to wind-velocity pulsations whereas at greater angles temperature pulsations had to be taken into account. Scattering at $\Theta = 180^\circ$ depended on Card 3/6

S/506/62/000/004/004/005
E032/E314

Experimental studies

temperature pulsations only, in agreement with theoretical predictions. In comparing the scattering intensity with the structural constants C_V and C_T for the wind-velocity and temperature profiles it was necessary to take into account the dependence of the numerical parameters a and b , entering into the formula for C_V and C_T , on the Richardson number Ri . TITLE: Flickering of the image of an artificial light source in the surface layer of the atmosphere

SOURCE: AN SSSR. Astronomicheskii sovet. Opticheskaya nestabil'nost' zemnoy atmosfery (Optical instability of the earth's atmosphere). Moscow, Izd-vo Nauka, 1965, 32-39

TOPIC TAGS: atmospheric turbulence, atmospheric refraction, wind velocity, temperature gradient, *free atmosphere*

ABSTRACT: Apparatus used for measuring fluctuation of wave fronts was described previously by the authors (Izv. vyssh. uch. zav., Radiofizika, 4, No. 5, 1961). Measurements were made at night in August of 1960 at the Tsimlyanskaya nauchnaya stantsiya Instituta fiziki atmosfery (Tsimlyanskiy Scientific Station of the Institute of Atmospheric Physics). Directed light sources (projectors) were set up at distances of 125, 250, 500, 1000, and 2000 m. The angle of light was about 2°. Average values for 10 minutes were used. Flickering was measured, and vertical profiles of wind velocity and temperature were determined to a height of 12 m. The dependence of flicker dispersion on height was determined. Measured and computed values of this

Card 1/2

2

L 15308-66

ACC NR: AT6003707

2

dispersion were compared and found to be in good agreement. The authors show that the vertical distribution of average wind velocities and of temperature in the surface layer of the atmosphere may be used to compute reliably the amount of flicker by means of the theory advanced by V. I. Tatarskiy (Teoriya flyuktuatsionnykh yavleniy pri rasprostraneniі voln v turbulentnoy atmosfere. Izv. AN SSSR, M., 1959). To make comparable computations when the ray passes through the entire atmosphere, it is necessary to know the relationship of C_n (the structural constant of the refractive index n) to dT/dz and du/dz (T is the Kelvin temperature, u the wind velocity, and z the height) in the free atmosphere, in addition to the vertical profiles of wind velocity and temperature. These relationships are now being investigated by L. R. Tavang (Izv. AN SSSR, ser. geofiz., 10, 1963). Measurements confirm the view that the mean square fluctuation of the angle of light-wave incidence is proportional to the distance of turbulent medium through which the light passes. The fluctuation spectrum of the incident angle agrees satisfactorily with theoretical computations on the basis of the Kolmogorov-Chukhov turbulence theory, and it supports the validity of the "frozen turbulence" hypothesis. The dimensionless spectra of incident-angle fluctuation of light and sound waves are rather similar. Orig. art. has: 4 figures and 8 formulas.

TITLE: Fluctuation of the direction of propagation of light waves in a heterogeneous turbulent medium

SOURCE: IVUZ. Radiofizika, v. 9, no. 1, 1966, 50-56

TOPIC TAGS: light propagation, atmospheric turbulence

ABSTRACT: The measurements are reported of the dispersion and frequency spectrum of fluctuation in the direction of light emanating from the edge of the Sun disk. A Sun telescope was installed in a flat steppe area, near Tsimlyansk. The Sun's rays passed through the entire thickness of the Earth's atmosphere. The measurements were made in August, 1963, with little or no clouds present. Turbulence characteristics near the telescope were measured in all experiments. It was found that: (1) Reduced to the zenith, the mean-square fluctuation of the light-wave direction ($\sigma_y = 1-1.5$ ang. sec.) exceeds by several times the values

ABSTRACT: The article deals with a study of fluctuations in the direction of wave propagation from an extended light source in an atmosphere with turbulent pulsations of the refraction index. A luminous filament, sufficiently distant from the refracting atmosphere, is used as the extended source, which makes it possible to limit the investigation to plane waves. The correlation function is calculated for the fluctuations in phase difference from the different points of the extended source in the case when the atmosphere is a uniform isotropic layer adjacent to the receiving

Structural changes in the kidneys due to gold compounds. ANTAL KALLÓ.. Magyar Orvosi Arch. 33, 211-18.—Structural changes in the kidneys of 60 rabbits, cats and rats were observed after the administration of Au compds. AuCl ₃ , Krysolgan, Trypal, Sanocrysine, KAUCN), Aurophon, Solganal and Solganal II were used. Properly increased doses of these Au compds. produce effects similar to those of heavy metal salts. The changes according to the dose were: hyperemia with smaller diapedesis, degeneration of the contorted tubules and interstitial infiltrations. Doses causing death after more than 3 hrs. always produce a necrotic nephrosis. Insufficiency of the kidneys is the cause of death. Therapeutic doses as used in practice may cause a degeneration of lesser importance accompanied with albuminuria. Chrysotherapy is much in vogue lately, but it is shown that due care should be maintained in such therapy.

Budapest, Orvosi Hetilap, Vol 103, No 23, 9 June 63, pages 1075-1080.

Abstract: [Authors' Hungarian summary modified] Two cases are reported among sisters with symptoms identical with those reported by Donohue. The characteristic changes are mainly due to early ripening of the ovarian follicle, (probably during the 6-7 intrauterine months), accompanied by an overproduction of estrogens. It resulted in hyperplasia of the nipple and external sex organs, hypertrichosis, increased 17-ketosteroid excretion, hyperfunction of the Langerhans isles and parathyroids as well as a decrease of the growth hormone of the pituitary. The syndrome is similar to the Stein-Leventhal syndrome of adults and may be its intrauterine analogue. Available data give no suggestions for the cause of this early ripening of the follicles. 1 Hungarian, 5 Western references.

"Investigations of Ziegler-Natta Catalyst Systems (Preliminary Communication)"

Budapest, Magyar Kemiai Folyoirat, Vol 72, No 3, Mar 66; pp 140-141.

Abstract [Authors' English abstract]: Study of the $\alpha\text{-TiCl}_3/\text{AlEt}_3$ catalyst system has shown that the crystalline structure of $\alpha\text{-TiCl}_3$ varies according to its preparatory conditions. This factor has a substantial effect on the rate of polymerization. In our final paper the study of two types of $\alpha\text{-TiCl}_3/\text{AlEt}_3$ catalyst systems will be described and their effect on the molecular weight distribution as well as the effect of the crystal size of $\alpha\text{-TiCl}_3$ on the polymerization rate will be discussed. TITLE: Observations of an Artificial Comet at Byurakan - I. With the
"Kometa A" Unit

PERIODICAL: Astron. tsirkulyar, 1959, 15 Okt., No. 205, pp. 2-3

TEXT: On September 12, 1959, beginning in 21^h 35^m 0^s Moscow time, the continuous photographing were carried out of the sodium cloud artificially originated by the second Soviet cosmic rocket; the unit "Kometa A" was used. Six pictures were obtained. The greatest density of blackening was observed in the direction near the rocket motion direction. The coordinates of the cloud center were roughly estimated. A table is added of the computed values of the cloud diameters for its different evolution stages. The average rate of expanding was of the order of 1.3 km/sec. According to the last photograph the cloud diameter amounted to about 1,500 km. The instant of flash is in the interval from 21^h 49^m 20^s to 21^h 49^m 35^s. The sodium cloud was photographed also by the 21 - 21" Schmidt-telescope; two photographs were taken. From the first, the equatorial coordinates

TITLE: On the dynamical instability of certain groups of galaxies.

PERIODICAL: Akademiya Nauk Armyanskoy SSR Doklady, v. 34, no. 1, 1962, 19-23

TEXT: Four groups of galaxies are analysed, having a total positive energy. The four groups are: 1) NGC 68, 69, 71, 72 and an anonymous galaxy; 2) NGC 80, 83; 3) The double galaxy 7385, 7386; 4) A chain of galaxies at $\alpha_{1950} = 1^h 4^m 6^s$; $\delta_{1950} = + 32^\circ 8'$. When applying the virial theorem, the mass-luminosity ratios obtained in very high: 260-685. The masses of the galaxies so calculated are by an order of magnitude greater than the masses calculated assuming a more reasonable mass-luminosity ratio of 60. The results obtained indicate that some galaxies and groups of galaxies are unstable. If the above galaxies and groups of galaxies are assumed stable, the mass-luminosity ratio becomes very high, a fact not supported by any other evidence.

TITLE: The nuclei of barred galaxies⁷

SOURCE: Byurakan. Observatoriya. Soobshcheniya, no. 36, 1964, 31-43

TOPIC TAGS: galaxy, astronomy, radio astronomy, photometry, calorimetry, ^{ASTROPHYSIC}observatory

ABSTRACT: The results of photometric and calorimetric investigations of 50 barred galaxies are presented. The 50 galaxies included in the study are taken from all four sub-types from SBO to SBC with known radial velocities and apparent magnitudes greater than 13^m. The observations were made on a 21--21" telescope of the Schmidt system of the Byurakan Observatory. "Agfa Astro Platten" film for the blue rays and "Kodak Oa-F" film for orange rays and an OG-1 filter were used. The light system was determined by the equation $CI_{int} = 0.8 CI$, where CI is the light constant in the

system used. A table is presented showing the observation data on the fifty galaxies studied. The results lead to the hypothesis that in SBO galaxies there is a strong central "bunching" in which, in all likelihood, there is a star-like center. In SBa and ~~APPROVED FOR RELEASE: 08/10/2001~~ ~~CIA-RDP86-00513R000620120018-1~~ defined against the background of the central agglomeration. On the other hand, the

centering tendency is absent in the SBc sub-type, and the centers are quite weak. The large dispersion of center radiance in the boundaries of the SBa and SBb sub-types indicates that the development of the center occurs to a large degree independently of the morphological structure of the galaxy. The authors thank V. A. Ambartsumyan for his comments and interest in the work and B. Ye. Markaryan for his consultations in the process of developing the material. TITLE: On the polarisation of the cometary nebula NGC 2261

SOURCE: Byurakan. Observatoriya. Soobshcheniya. no.30. 1962.
45-50

TEXT: A polarimetric study of the NGC 2261 nebula, which has variable characteristics, is reported. The observations were carried out on the Schmidt telescope of the Byurakan Observatory. Nine 45-minute exposures were recorded on Kodak 0a-0 plates with the polaroid at 0, 60 and 120°. The method employed in the observations and in the measurements on the negatives was described in an earlier paper (E.Ye. Khachikyan, Voprosy kosmogonii, VII, 1961, 333). The polarisation was calculated as described by D.A. Rozhkovskiy (Astronomicheskiy tsirkulyar, no.166, 1956, 13). Two sets of polarisation measurements were obtained, one for December 24-25 1960, and the other for January 13, 1961. The general pattern of the polarisation is the same as that reported earlier by E.Ye. Khachikyan (Soobshcheniya Byurakanakoy observatorii, v.25, 1958, 67) except that the mean degree of

Card 1/2

On the polarisation of the cometary...

S/620/62/000/030/001/002
E032/E114)

polarisation for the first of the above sets of measurements was 18%, and for the second, 16%. As before, a very high degree of polarisation is observed at the edges of the nebula, particularly on its eastern boundary. A new bright filament was found with the plane of preferred vibrations almost exactly at right angles to the line connecting the filament to the centre of the nebula. There are 2 figures and 1 table. ✓

Diagnosis of uric acid diathesis by analysis of mucus
József Kallós, Országos Hírlap 82, 108-111 (1936) The normal uric acid content of stomach mucus varies from 2.5 to 4.0 mg. %. It is constant for the individual if the diet and the time of sampling are similar. Subjects having low uric acid contents mostly had rheumatic conditions. To det. the uric acid measure 1 cc. mucus into a test tube, add 1 cc. 20% Na_2CO_3 soln. and 3 drops of the uric acid reagent (prepd. by dissolving 25 g. Na tungstate in 100 cc. water, adding 20 g. 80% H_2O_2 , and boiling for 1-2 hrs.), then 3 drops of 20% NaOH soln. Titrate with 0.01 N $\text{K}_2\text{Fe}(\text{CN})_6$ until the bluish color disappears. Multiply the no. of cc. by 100, and divide by eleven to get the content of uric acid in mg. %. A detn. requires 3-4 min.

Kallós, Mrs. Imre. A csapadékmennyiség és a nedvességtartalom kapcsolata. [Relation between precipitation amount and humidity]. *Időjárás*, Budapest, 61(1):191-192 May/June 1957. 8 figs., table, 4 refs. English summary p. 191. **DLC**--Weather: during the first half of July 1955 is analyzed from the point of view of water-vapor content of the air. Precipitation of larger amount has been recorded during the observational period only when the numerical value of the water vapor content considerably surpassed the average value of July. In analyzing specific moisture it turned out that the largest advection of moisture took place on 850 and 700 mb levels. In connection with the large amount of precipitation of July 9, the author points out that in Transdanubia large amounts of precipitation are to be expected in case of a cyclone coming from the south and passing over the Carpathian basin with its warm sector in northern direction. After that, rainy weather is to be expected if an anticyclone is forming north and north-east, respectively, from the Carpathians and this hinders the cyclone in moving out of the Hungarian basin. **Subject Headings:** 1. Humidity-precipitation amount relationships 2. Cyclonic precipitation 3. Transdanubia, Hungary--Author's abstract.

TITLE: Quantum field theory equations in the axiomatic approach

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 49, no. 5, 1965, 1611-1623

TOPIC TAGS: quantum field theory, S matrix, matrix function, difference equation

ABSTRACT: The purpose of the investigation was to determine the invariant properties of the S-matrix elements previously derived by one of the authors (Faynberg, ZhETF v. 47, 2285, 1965 and earlier) for an axiomatic formulation of quantum field theory, and to obtain in explicit form equations for n-point diagrams in difference or integral form, with the quasilocal term eliminated. It is shown within the framework of this formulation that the undetermined quasilocal terms can be expressed in terms of R-functions when the values of some of the invariants are fixed. An analysis is made of the invariants on which the v-functions on the mass shell depend, the range of variation of these invariants in the equation, and

Card 1/2

L 13128-66

ACC NR: AF6000222

the best choice of independent variants in the case of an arbitrary n -point diagram. The invariant properties of the retarded matrix elements of v -functions are used. It is shown that on the mass shell the v -functions depend in the physical region only on invariant scalar products of 4-vectors. Equations in difference form are derived first for 3-, 4-, and 5-point diagrams, and the special nature of the boundary conditions at the threshold and at infinity is explained. The method is then generalized to a 6-point diagram. The equations derived and the prospects for solving them beyond the scope of perturbation theory are briefly discussed. Orig. art. has: 25 formulas.

TITLE: Physical and Technical Properties of Kolkhida Gleyed Soils and Their
Variation Under Influence of Electric Current (Fiziko-tekhicheskiye svoystva
kolkhidskikh ogleyennykh gruntov i ikh izmeneniye pod deystviyem
elektricheskogo toka)

PERIODICAL: Tr. Gruz. n.-i. in-ta gidrotekhn. i melior., 1957, Nr 18-19,
pp 471-484

ABSTRACT: Gleyed soils be¹long with the marsh-type highly-compressible soils
that have a low water permeability. To improve their inferior construction
properties, it is recommended that electrization and electric osmosis be used;
these measures considerably improve their water resistance, reduce their
swelling and shrinkage, augment their permissible vertical load 2.5-3.5 times,

Card 1/2

SOV/112-59-2-2721

Physical and Technical Properties of Kolkhida Gleyed Soils and Their Variation
and reduce their compressibility factor 4-5 times. Electric current density of
2.5-20 amp/m² is used to strengthen the gleyed soils. Electric-energy
consumption is 60-70 kwh/m³ of soil. Compression curves for gleyed and non-
gleyed soils are presented.
